

TRANSPORTATION POLICY

Document ID: DOC-001 | Version: 3.0 | Effective: 2026-01-01 | Status: ACTIVE
Supersedes: DOC-002

1. Purpose

This policy establishes corporate requirements for national transportation performance, service-level management, critical deliveries, carrier governance, and logistics performance monitoring.

2. Scope

Applies to domestic transportation operations managed by Supply Chain, including contracted carriers, distribution centers, and business units receiving transported goods.

3. Transportation service categories and SLA

The delivery SLA is measured from confirmed carrier collection to delivery confirmation. Unless a formally approved exception applies, the following service levels govern:

Service category	Delivery SLA	Operational interpretation
Standard	3 business days	Default domestic service for regular replenishment and non-urgent flows.
Express	1 business day	Priority service for time-sensitive business demand.
Scheduled	Delivery on approved appointment date	Used when destination receiving capacity or customer appointment controls delivery timing.

4. OTIF performance target

OTIF (On Time In Full) measures deliveries completed within the committed delivery window and with the complete required quantity. The detailed calculation method is maintained in the Logistics KPI Dictionary.

The corporate target for national transportation operations under this version is **97% OTIF**.

5. Critical deliveries

A delivery is classified as critical when at least one of the following applies: production or customer operation may stop without the shipment; a contractual customer commitment is at immediate risk; a regulatory or safety-related business deadline is at risk; or the responsible Supply Chain manager formally designates the shipment as critical based on documented business impact.

A delayed critical delivery must follow the active Critical Delivery SOP. The SOP defines notification sequence, escalation timing, contingency assessment, and closure evidence.

6. Carrier performance governance

Carrier performance must be monitored using OTIF and the additional indicators defined in the Logistics KPI Dictionary. Repeated SLA breaches must be handled under the active Carrier Management Policy.

7. Exceptions and governance

Any exception to service-level requirements must be documented and approved under the applicable authority matrix. This policy does not replace contractual obligations where a carrier contract imposes stricter requirements.

8. Revision summary

Version 3.0 increases the national OTIF target from 95% to 97%, effective 1 January 2026, following the 2025 Operations Committee decision.

Version 3.0 clarifies the critical-delivery definition and explicitly links delayed critical shipments to the active Critical Delivery SOP.

Version 3.0 strengthens cross-reference to carrier performance governance and approved exception controls.

Document control

Controlled synthetic document generated for the Enterprise Knowledge AI System evaluation corpus. Operational authority is determined by document status, effective date, and the Document Governance Policy.
