

TRANSPORTATION INCIDENT REPORT — R001

Document ID: DOC-017 | Incident date: 2025-08-14 | Status: CLOSED | Route: R001 | Carrier: Atlas Logistics

1. Executive summary

Route R001 experienced a critical-delivery delay after a vehicle capacity issue and late contingency activation. The shipment was ultimately delivered after escalation, but the event exposed weaknesses in contingency readiness and escalation discipline.

2. Business impact

Delivery occurred outside the committed window and required operational escalation. No safety event occurred. The principal impact was risk to the receiving operation and additional coordination effort.

3. Event timeline

Time / stage	Event
Collection	Shipment collected under the planned service window.
Exception detected	Carrier reported that the assigned vehicle could not complete the planned movement because available capacity was insufficient.
Critical status confirmed	Transport Planning classified the shipment as critical due to immediate downstream operational impact.
Escalation	Atlas operational management was contacted and a recovery vehicle was requested.
Recovery	Alternative capacity was activated and a revised ETA communicated.
Closure	Shipment delivered; incident review opened for governance follow-up.

4. Root-cause findings

Primary cause: insufficient capacity assurance before dispatch on a critical route.

Contributing cause: contingency capacity was not pre-confirmed for the affected operating window.

Contributing cause: initial escalation did not provide a sufficiently reliable recovery ETA.

5. Corrective and follow-up actions

Require Atlas to document contingency capacity for R001 critical movements.

Introduce a pre-dispatch capacity confirmation for designated critical R001 shipments.

Track contingency readiness and escalation response through the corrective-action process.

6. Related governance

Transportation Policy; Critical Delivery SOP; Carrier Management Policy; applicable carrier contract; Corrective Action Tracker.
